

Electropolished draining channels

New !

New by presses are electropolished draining channels, which are now a standard equipment of all the presses with closed drum design PST .

Electropolished surface characteristics:

- ▶ with electropolishing all impurities of the basic material are removed
- ▶ material surface irregularities are evened and cleaned
- ▶ glossy and shiny surface
- ▶ distinctively reduced surface roughness
- ▶ increased resistance to corrosion
- ▶ extended product life

Advantages of electropolished draining channels:

- ▶ sticking of grape pomace on the draining channels surface is reduced, which consequently leads to a better flow of must and liquid through drainage holes
- ▶ better and faster cleaning of the draining channels, which also results in reduced water consumption
- ▶ reduced possibility of building of coats on the material
